

IN THE SPECIFICATION

Replace the paragraph beginning on line 23, page 6, with the following amended paragraph:

The preferred alginate is conveniently in the form of a sodium salt, and is preferably an alginate having a high percentage of polyguluronic acid units (known as high G alginates) as these produce encapsulates with improved stability on storage. Suitable alginates are commercially available, and include, for example, the high G alginate Manugel "MANUGEL" DMB (Manugel "MANUGEL" is a Trade Mark) supplied by NutraSweet Kelco. The aforementioned alginates provide a strong structure, which can for example be incorporated into a detergent composition using standard mixing techniques, and which keep the rigidity of the capsules on storage.

Replace the paragraph beginning on line 27, page 10, with the following amended paragraph:

The builder system in heavy duty laundry liquids is typically made up from a combination of sequestrants, deflocculants, dispersants, and alkaline buffers. This includes ingredients such as phosphates, typically sodium or potassium polyphosphates and especially sodium triphosphosphate, sodium silicates and carbonates that precipitate polyvalent cations as their insoluble silicates, carbonates, or hydroxides are also used. Other ingredients used as builders are citrates, aluminosilicates, borates, 'dequest' "DEQUEST" (Ethylene diamine tetra methylene phosphoric acid) and EDTA (Ethylene diamine tetra-acetic acid).

Example 5

Dilution release trial were carried out on laundry liquid samples containing the encapsulate system as detailed in Example 1. The test method involved the dilution of 2.5g of the laundry liquid in a 300 ml glass jar, with 200g of tap water. The sample was placed on a ~~Luckham Multimix~~ "LUCKHAM MULTIMIX" MM1 Rock-roller (~~Luckham Multimix~~ "LUCKHAM MULTIMIX" MM1 Rock-roller is a Trade Mark), and complete dissolution of the capsules occurred at all water temperatures between 10 to 50°C.
